PLAN FILE MODIFICATION REQUEST — ARCHITECTURE PIVOT

We need to significantly modify the current ExileLab project architecture and product direction.

Do NOT create a standalone ecosystem that competes directly with existing Path of Exile 2 build platforms.

Instead, pivot the product into an **Intelligent Build Optimization Layer** that sits on top of existing community build platforms.

The existing PLAN.md should be modified according to the following changes.

CORE PHILOSOPHY CHANGE

Old approach:

Build an all-in-one standalone platform containing:

- Build marketplace
- Character doctor
- Optimizer
- Market intelligence
- Independent build ecosystem

New approach:

Do NOT compete with existing ecosystem players.

Instead:

Leverage and integrate existing trusted build sources such as:

- Maxroll
- Mobalytics
- poe.ninja
- Community Path of Building links
- Build guides from creators
- Public build repositories

The product should become:

A build intelligence engine that aggregates existing build sources and optimizes builds based on personalized user preferences.

We are not replacing these platforms.

We are building an optimization layer above them.

REMOVE OR RESTRUCTURE PRODUCT PILLARS

Remove or heavily reduce these sections from PLAN.md:

- Build Market
- Independent build marketplace
- Creator submission platform
- Public build hosting infrastructure
- Ladder ingestion as a core product pillar

The product no longer needs to become a build ecosystem.

Instead, focus entirely on optimization and build intelligence.

NEW PRODUCT POSITIONING

The platform should now act as:

A personalized build optimizer for Path of Exile 2 players.

Workflow:

User imports a build from:

- Maxroll guide
- Mobalytics guide
- poe.ninja build
- Path of Building share code
- Creator build link

System analyzes the imported build.

Then optimizes according to user-defined priorities.

NEW PRIMARY FEATURE — PERSONALIZED BUILD OPTIMIZER

The most important feature in the entire product.

The optimizer must NOT assume every player wants maximum DPS.

Different players value different characteristics.

The system must allow user-controlled optimization priorities.

Implement a weighted preference engine.

USER PRIORITY SLIDER SYSTEM

Introduce a preference allocation system.

Users can define how the optimizer should prioritize build decisions.

Possible optimization categories:

Damage Output

How much raw damage the build should prioritize.

Survivability

Defense layers.

Energy shield.

Armor.

Evasion.

Block.

Effective HP.

Movement Speed

For builds where mobility matters.

Fast map clear.

Travel speed.

Positioning.

Attack Speed

Important for builds where attack frequency matters.

Can affect DPS but can also affect movement patterns.

Cast Speed

For spell based builds.

Skill Mobility Efficiency

Important for builds where movement happens via skill spam rather than walking.

Example:

Whirling skills.

Dash loops.

Movement through repeated skill usage.

Resource Sustain

Mana sustain.

Spirit efficiency.

Cooldown management.

CONTEXT AWARE OPTIMIZATION ENGINE

The optimizer must understand that not every build values the same attributes.

This is extremely important.

Optimization logic must be context aware.

Examples:

Example 1

Twister Huntress build.

Movement is not traditional movement speed.

The build uses repeated attacks for movement.

Therefore:

Movement speed stat is low priority.

Attack speed directly affects movement.

Optimization priority becomes:

- Attack Speed = High
- Damage = Medium
- Movement Speed = Low

Example 2

Fast mapper build.

Player wants smooth farming.

Priorities:

- Movement Speed = High
- Damage = Medium
- Survivability = Medium

Maximum damage is NOT required.

Example 3

Boss carry build.

Player wants enough damage to carry six players.

No need for excessive overkill DPS.

Priorities:

- Damage = Enough for six-player scaling
- Survivability = Medium
- Attack Speed = High

Do NOT optimize for maximum theoretical damage.

Optimize for target performance requirement.

Example 4

Budget efficient player.

The player can clear all content.

They do NOT want huge damage numbers.

They want efficiency.

Priorities:

- Damage = Moderate
- Survivability = High
- Currency Efficiency = High

Avoid expensive upgrades.

Avoid over-optimization.

REPLACE STATIC BUILD ANALYSIS WITH GOAL BASED ANALYSIS

Current system assumes:

Higher DPS = better.

This must be changed.

New logic:

The system should optimize according to user goals.

Possible user goals:

- Fast mapping
- Boss farming
- Party carry
- Tanky build
- Budget farming
- Smooth gameplay feel
- Speed clearing
- Hardcore survivability
- Maximum DPS
- Balanced performance

NEW BUILD DATA SOURCES

Instead of building an internal build marketplace, ingest build data from external community sources.

Primary sources:

- Maxroll build guides
- Mobalytics build guides
- poe.ninja build statistics
- Path of Building build links
- Public creator build repositories

Use these builds as optimization baselines.

The system should compare:

Current user build

vs

Multiple high performing public builds.

NEW COMPARATIVE OPTIMIZATION ENGINE

Instead of generating builds independently.

Compare against multiple known builds.

Example:

User imports Twister Huntress.

System fetches:

- Maxroll version
- Mobalytics version
- poe.ninja top player versions

Compare:

- Passive tree differences
- Gear differences
- Skill setup differences
- Damage output differences
- Attack speed differences
- Mobility efficiency differences

Then recommend changes.

REMOVE BUILD MARKET PHASE

Delete the entire Build Market roadmap section.

No creator marketplace needed.

No build submission platform needed.

No ranked build browsing infrastructure needed.

No public build hosting.

ADD BUILD AGGREGATION ENGINE

New component:

Build Aggregation Service

Responsibilities:

- Fetch external build data
- Normalize build structures

- Compare multiple builds
- Extract optimization patterns
- Find statistically common improvements

NEW PRODUCT DIFFERENTIATION

The product is no longer:

"Netflix for builds"

The product becomes:

"An intelligent build optimizer that adapts builds to YOUR playstyle"

Important distinction:

We do not tell players:

"This build does maximum DPS"

We tell players:

"This build is optimized for YOUR preferred gameplay priorities"

REWRITE ROADMAP

Remove roadmap items related to:

- Build marketplace
- Creator platform
- Public build hosting
- Ladder ingestion as product pillar

Add roadmap items for:

- Build aggregation engine
- Preference weighting system
- Context aware optimization engine
- Multi source build comparison engine
- Goal based optimization system
- User slider preference system

FINAL PRODUCT IDENTITY

The final product should be positioned as:

A personalized Path of Exile 2 build optimizer that learns what the player values.

Not every player wants maximum damage.

Some players want:

- Smooth movement
- Attack speed responsiveness
- Budget efficiency
- Survivability
- Fast farming
- Balanced gameplay feel

The optimizer must understand player intent and optimize accordingly.

This philosophy should replace the previous standalone ecosystem strategy throughout the entire PLAN.md document.
